

This project delivers more than a machine learning model—it provides a **decision-support system for customer retention**. By identifying the key drivers of churn and predicting high-risk customers in advance, the solution empowers telecom businesses to implement targeted retention strategies, reduce revenue loss, improve customer lifetime value, and optimize resource allocation. The project illustrates how machine learning can generate measurable business value by converting customer data into actionable insights that support strategic growth and competitive advantage.

Business Impact:

This project demonstrates how predictive analytics can transform historical customer data into actionable business intelligence.

The solution enables organizations to:

- Predict customers likely to churn before revenue is lost.
- Prioritize high-risk customers for personalized retention campaigns.
- Reduce customer acquisition costs by improving existing customer retention.
- Increase customer lifetime value through targeted engagement strategies.
- Optimize marketing and customer support budgets using data-driven insights.
- Improve operational decision-making by focusing resources on the highest-impact customer segments.
- Build a scalable predictive framework that supports long-term revenue growth and customer satisfaction.
